5 Some final thoughts

Through the two methods we implemented in this notebook, we can see that the pairs trading strategy is profitable after so many years. The distance method is not so flexible compared to the Engle-Granger method because the long short ratio is fixed to 1:1. But the results are not so different.

There are some future work we can do to improve and explore the strategy: 1. We can adjust the long short ratio to see if the strategy is more profitable using the two step Engle-Granger method. 2. “Generalized pairs-trading”, or trading groups of stocks against other groups of stocks, is a natural extension of pairs-trading. A generalized pairs trading book, or statistical arbitrage book, consists of a collection of “pair trades” of stocks relative to the ETF (or, more generally, factors that explain the systematic stock returns). In some cases, an individual stock may be held long against a short position in ETF, and in others we would short the stock and go long the ETF. Due to netting of long and short positions, we expect that the net position in ETFs will represent a small fraction of the total holdings. The trading book will look therefore like a long/short portfolio of single stocks. We can use this idea to construct a more flexible portfolio.
